INDEXES OF REAL DOMESTIC PRODUCT BY INDUSTRY

(1961 BASE)

Published by Authority of
The Minister of Trade and Commerce

Digitized by the Internet Archive in 2024 with funding from University of Toronto

PREFACE

Constant price measures require periodic rebasing and revision if their quality is to be maintained and improved. It is also important that historical continuity and consistency with other related series be safeguarded as far as possible. This paper attempts to accomplish these objectives by presenting Real Domestic Product by industry of origin (including special component industry aggregates such as the Index of Industrial Production) on a 1961 weight and reference base, and by introducing a number of important improvements such as the 1960 Standard Industrial Classification of industries and more up-to-date annual levels.

The previously-published 1949-based indexes have been revised up to 1961 to incorporate revisions based on census and other survey data and to bring in some seasonal adjustment improvements in the early record. Beginning with 1961 the series are on a 1961 weight-base and a number of innovations have been made to improve the accuracy of monthly and quarterly projectors in the most recent years.

Monthly, quarterly and annual tables in the report provide continuous historical records for many industry and industry group series on a 1961 reference base. Other tables provide additional information relating to industrial detail covered in the calculations. Of particular interest to analysts will be the table comparing the 1948 and the 1960 Standard Industrial Classification systems which provides detailed information on individual industry

series that are considered to be linkable, i.e., sufficiently comparable between the two S.I.C. systems so as not to distort historical continuity.

Changes and improvements are briefly described in technical notes contained in the report. The conceptual basis of the Real Domestic Product (RDP) measures remains the same as described in the DBS occasional papers, "Revised Index of Industrial Production, 1935-1957" (Catalogue No. 61-502) and "Indexes of Real Domestic Product by Industry of Origin, 1935-1961" (Catalogue No. 61-505). Data sources and basic methodology are also largely unchanged with more important changes described in the technical notes of this report. The monthly report "Index of Industrial Production" (Catalogue No. 61-005) and its supplements will continue to be the publication in which these indexes will be kept up-to-date.

The present report was produced in the Industrial Output Section of the National Accounts, Production and Productivity Division, Economic Accounts Branch under the direction of Gordon J. Garston, Chief of that Section. Other staff members having major responsibility for various aspects of this report include Miss A. Ansmits (1961 industry weights), G. Bissessar (annual levels for the service-producing industries), B. Lynch (Monthly Index of Industrial Production), Miss A.I. McArthur (classification links and report assembly), M. Palme (annual levels for the goods-producing industries) and C. Parent (Quarterly Real Domestic Product). Inquiries relating to any one of the particular areas noted above should be directed to the appropriate officer.

WALTER E. DUFFETT,

Dominion Statistician.

NOTE re HISTORICAL CONTINUITY

1. For a continuous record of the Index of Industrial Production and its components, the sources are as follows:

This publication, Indexes of Real Domestic Product by Industry — (1961 Base), DBS Catalogue No. 61-506 — The period from 1919 to 1967.

Index of Industrial Production (1961 = 100), DBS Catalogue No. 61-005—Current indexes beginning January, 1968.

2. For a continuous record of the Index of Real Domestic Product and its components, the sources are as follows:

This publication, Indexes of Real Domestic Product by Industry — (1961 Base), DBS Catalogue No. 61-506 — The period from 1935 to 1967.

Index of Industrial Production (1961 = 100), DBS Catalogue No. 61-005 — Current indexes beginning January, 1968.

CONCEPTS, SOURCES AND METHODS

DBS Catalogue No.61-502 — See this publication for description of concepts, sources and methods for the Index of Industrial Production.

DBS Catalogue No.61-505 — See this publication for description of concepts, sources and methods for Real Domestic Product by Industry of origin.

DBS Catalogue No. 61-506 — See this publication for technical notes concerning major changes in concepts, sources and methods in Real Domestic Product (including the Index of Industrial Production) resulting from the introduction of the 1960 Standard Industrial Classification and the adoption of the 1961 weight and reference base.

SYMBOLS and CODES

The interpretation of the symbols used in the tables thoughout this publication is as follows:

- .. figures not available
- nil or zero
- -- amount too small to be expressed
- n.e.c. or n.e.s. not elsewhere classified or specified
- S.I.C. code: The Standard Industrial Classification code appearing in the tables should be interpreted as follows:
 - S.I.C. Division is indicated by a single figure.
 - S.I.C. Major group within the Division is indicated by two digits following the Division code.
 - 3- or 4-digit industry is indicated by 3 or 4 digits respectively.

DESCRIPTION OF REVISIONS TO REAL DOMESTIC PRODUCT

This report presents revised estimates of Real Domestic Product (RDP) by industry for the period 1949-67 as well as the complete back record of annual and sub-annual measures of Real Domestic Product (including the Index of Industrial Production), extending back as far as 1919 for some series. Except for the changes indicated in this report the concepts and general methodology remain as stated in previous reference papers.

The most important features of the revision are the introduction of the new 1961 weight and reference base and the 1960 standard industrial classification (S.I.C.)² as of 1961, and the revision of the 1949-based indexes outside the area of the Index of Industrial Production for the years 1949-60. This latter revision is essentially similar to that incorporated in the Index of Industrial Production in May, 1966.³ In addition, the following major changes were made: improved and more up-to-date annual levels were incorporated into the system; the sub-annual projection techniques were improved for many industries; and the sub-annual measures were seasonally adjusted using the latest (X-11) variant of U.S. Census Method II.

Tables 1, 4, 5 and 6 of this report show the new 1961-based system on an annual, quarterly and monthly basis. These revised indexes replace the previously published record for the period commencing in 1961, contained in the May 1966 supplement to the monthly 'Index of Industrial Production" publication, DBS Catalogue No. 61-005, and all subsequent monthly issues of that publication containing data to the end of 1967. For the pre-1961 period, the indexes shown in Tables 2, 3, 7, 8 and 9 have been mechanically converted to a 1961 reference base by linking to the 1961-based system in 1961 (and 1946). Users will note that because of the introduction of the new S.I.C. and certain conceptual changes, the measures for some industries are no longer comparable between the 1949 and the 1961 weight-base periods and therefore are not shown in these tables prior to 1961. Those industries which were considered comparable are shown on a continuous basis as far back as data permit.

Tables 2, 7, 8 and 9 show the annual, quarterly and monthly industry indexes on a 1949 weight and reference base, for the period 1946-61. They replace the previously published record (for the period commencing in 1949) contained in DBS Reference Paper, Catalogue No. 61-505, "Indexes of Real Domestic Product by Industry of Origin, 1935-61", and

in the May 1966 supplement of the monthly "Index of Industrial Production" publication, DBS Catalogue No. 61-005. Except for rounding differences, and changes to 1959 and 1960 resulting from the incorporation of comprehensive annual benchmark levels into the published record for manufacturing, the entire revision to the Real Domestic Product estimates originates from industries outside the Index of Industrial Production. The revisions are essentially trend adjustments resulting from the incorporation of 1961 census and other comprehensive annual benchmark levels for all industries for which these were not previously available, and will be discussed in more detail below.

Table 3 presents the annual data for the 1935-1946 period on a 1935-9 weight and reference base as this is the weight-base underlying the previously published estimates for this period contained in DBS Catalogue No. 61-505, "Indexes of Real Domestic Product by Industry of Origin, 1935-61". Users will recall that in that publication the 1935-9-based indexes were linked to the 1949-based system in 1946 and shown as continuous series on a 1949 reference base. A description of the derivation and the limitations of the 1935-9 industry weights is contained in the above-mentioned reference paper (DBS Catalogue No. 61-505), p. 52, para. 76.

S.I.C. Changes

As mentioned above, the single most important aspect of the revisions contained in this report consists of the adoption of the more up-to-date 1961 weight and reference base along with the introduction of the 1960 S.I.C. The latter constitutes a major change in the industry of origin system. The new standard industrial classification system is intended to reflect a more current industrial structure than that depicted in the 1948 S.I.C.4 on which the industry of origin system was based up to now. The changes are particularly significant at the lower level of industry detail where the effect of the far-reaching changes in technology and consumption patterns which the Canadian economy has experienced since the Second World War are most pronounced. Thus, the new classification system which has been adopted should provide analytically more meaningful industry data for the 1960's. The introduction of the 1960 S.I.C. into the Real Domestic Product measures should also facilitate comparisons with other Canadian industry-oriented statistics which have gradually been converted to this system or will be in the near future. Finally, analysts will note that the Canadian 1960 S.I.C. conforms much more closely to the International S.I.C. than did the earlier system, thus facilitating international comparisons.

3 "Index of Industrial Production", 1966 Annual Supplement, DBS Catalogue No. 61-005.

^{4 &}quot;Standard Industrial Classification Manual", DBS, 1948.

The effects of the introduction of the 1960 S.I.C. are shown in detail in the guide to classification changes contained in Appendix I. As can be seen, the changeover introduced a considerable amount of discontinuity into the historical record, particularly in the area of durable manufacturing. This is most evident from Table 1, where the number of series which could not be linked in 1961 can be seen at a glance. The problem is somewhat aggravated by the fact that although the Real Domestic Product system adopted the 1960 S.I.C. as of 1961, the new classification was introduced gradually over a number of years in the various industry areas for data collection purposes. For example, the last year for which the census of manufactures was collected on the basis of the 1948 S.I.C. was 1959, which also constituted the year of overlap between the two systems, since the data for that year were also retabulated on the 1960 S.I.C. for those industries where the changes were considered to be significant. 5 Manufacturing data from the year 1960 forward were collected on the 1960 S.I.C. only, and therefore these industry data in the Real Domestic Product system had to be worked on the new basis for the years 1959, 1960 and 1961 and linked in 1959 to the 1949-based system at the lowest level of comparability in order to carry the system through to 1961 on the old basis. Beginning with 1961, therefore, the 1960 S.I.C. was adopted for the industry of origin system as a whole. Outside of manufacturing, the 1960 S.I.C. was generally introduced as of 1961 for data collection purposes, although this was not uniformly the case and there remain some industry areas where full implementation of the new surveys is still pending. Thus the transition period poses particular problems in achieving completeness of coverage and continuity in a time series sense.

In addition to reflecting a more current economic structure, the 1960 S.I.C. also redefined the valuation boundaries of the basic reporting unit used in collecting industry statistics, namely, the establishment. Whereas previously many surveys, such as the census of manufactures, were collecting data on only the main (in this case, manufacturing) activity of the establishments, the new definition requires the collection and tabulation of data for all activities of each establishment, with sales or shipments valued as they leave the establishment boundary. This definition is intended to ensure greater consistency and completeness of data not only for each industry but for the economy as a whole. Thus it is important to note that the adoption of the new S.I.C. carries with it also the implementation of major conceptual or definitional changes which may have a significant effect on individual industry measures.

1961 Weight and Reference Base

The 1961 Gross Domestic Product at factor cost estimates on which the industry weights are

based, reflect the full implementation of the 1960 S.I.C., both in terms of industry structure and establishment definition. Users should note, however, that the annual and sub-annual industry measures for the post-1961 period contained in this publication, while reflecting the new industry structure, in many cases do not as yet incorporate the total activity concept, i.e., they are based on statistics designed to measure only the "main" activity of establishments. Most notable in this respect are the manufacturing and trade industries, which at this time are projected largely on the basis of the less comprehensive monthly measures (although the manufacturing data have been adjusted to preliminary main activity census-based levels which have been extended into the current period using related information such as industry shipments). The establishment total activity concept will thus not be fully incorporated into the Real Domestic Product system until the next major revision of the estimates expected to be completed by 1971. By that time it will be possible to present an updated description of concepts, methods and data sources used in the industry of origin RDP measures.

Rates of Growth, 1946-67

		Revised index
	pe	r cent
Real Domestic Product	4.5	4.7
Goods-producing industries	4.7	5.0
Index of Industrial Production ²	5.7	5.8
Service-producing industries	4.3	4.4

¹ Based on the least squares of logarithms method. ² Includes manufacturing, mines, quarries and oil wells, and electric power, gas and water utilities.

1961 Industry Weights

As in the case of the introduction of the new S.I.C., the adoption of a more current base period also serves to up-date the structure of the system, inasmuch as a new weight-base reflects the effects of a changed structure of relative prices, while a more recent reference base makes the system more manageable from the point of view of current analysis. The year 1961 was chosen as a base period largely because of the considerably more comprehensive survey coverage that is available in a decennial census year. For this reason it serves as a base for most DBS time series. In addition, the second Canadian Input-Output table was being calculated for 1961 and was heavily utilized in the preparation of the preliminary 1961 industry weights contained in this report, just as its predecessor had been in the 1949 industrial distribution of GDP. It should be stressed that the final distribution of Gross Domestic Product at factor cost for the year 1961 will not be available until the his-

⁵ See DBS Catalogue No. 31-203, "Manufacturing Industries of Canada, Section A", 1961, 1962, 1963, 1964.

torical revisions to the National Income and Expenditure Accounts have been completed, probably some time in 1969. By that time the final results of the 1961 Input-Output table will also be available, and following a detailed reconciliation of all the components of the entire System, the final 1961 industrial distribution of Gross Domestic Product will be derived. The revised industry weights will thus be incorporated into the Real Domestic Product system at the time of the next major revision. It is not expected, however, that the relative contributions of individual industries, except at the lower level of industrial detail, will be altered significantly.

Apart from changes in detailed methodology used to derive the components of Gross Domestic Product for individual industries, the basic problems and general data sources used in deriving the 1961 industrial distribution have remained essentially the same. Thus, for example, it continued to be necessary to utilize such sources as taxation records, company reports and operating results surveys in order to derive the operating surplus (consisting of corporation profits, net income of unincorporated business, investment income and depreciation) on an establishment basis. This in many cases necessitated the allocation of company data to their constituent establishments, largely because of the paucity of statistical information on purchased service inputs on an establishment basis. It should also be noted that at the 4-digit S.I.C. industry level, particularly in manufacturing, it continued to be necessary in most cases to distribute GDP on the basis of census value added.

There are, however, some significant conceptual differences between the 1949 and the 1961 systems which were incorporated into the industry weights and also carried forward into the post-61 period through changes in the projectors. All of these introduce a break in the series at 1961 and in some cases were significant enough to result in the series being considered not comparable between the two base periods. In these instances, the series are not shown for years prior to 1961 in Tables 1 and 4. The following is a list of the major conceptual changes:

1. In the 1949-based system imputed rent on government owned buildings, consisting of a net return and a depreciation estimate, was calculated and included under the rent component in the finance, insurance and real estate industry group. This estimate has been dropped completely from the 1961-based system. It has been replaced by new estimates of depreciation on all government-owned assets. These estimates are now included with the following industries: public administration and defence. education, hospitals and municipal waterworks, all of which form part of the government sector in the Income and Expenditure Accounts. It may also be noted that the imputation for owneroccupied residential dwellings continues to be included under the rent component of the finance, insurance and real estate industry group.

- 2. In the 1949-based system, construction was measured on an activity basis, that is to say, both contract and own account construction activity were included in the measure for construction. As of 1961, the construction activity carried out by an establishment's own employees has been excluded from the construction industry estimate and is included instead with the industry to which that particular establishment is classified. Thus the new construction industry estimate measures the value added of construction contractors and subcontractors only, including any repair construction carried out by these entities. Similarly, the annual construction industry measures pertain only to contract construction in the period from 1961 forward.
- 3. As of 1961 government liquor board profits have been defined as an indirect tax and therefore no longer form a part of the Gross Domestic Product at factor cost estimates.
- 4. Royalties received by governments, in particular resource royalties such as stumpage fees and royalties from oil and gas, ceased to be considered as an indirect tax as of 1961 and presently are included under the rent and royalty component of the finance, insurance and real estate group. Royalties received by individuals are also included here.
- 5. Various changes to the miscellaneous valuation adjustments which are being made as part of the historical revisions to the System of National Accounts have been incorporated in deriving the industry weights. Most of these changes are minor at the individual industry level.

Finally, it should be noted that as of 1961, with the implementation of the 1961 S.I.C., the "Other goods industries, n.e.c." group has been discontinued, and its three components are being measured under the appropriate S.I.C. groupings. The following changes were made to the composition of the non-commercial industry group as of 1961. Highway and bridge maintenance (S.I.C. 516), which is now a separate 3-digit industry, and the combination S.I.C. 576 and 579, water systems and other utilities, both of which form part of the government sector, have been added, as have miscellaneous services (S.I.C. 10-7). In the latter two cases the total group has been included for statistical reasons as it had to be projected in total in the current period.

The following table shows a comparison of the 1949 and 1961 weighting systems, at the S.I.C. division level, which shows the basic structural changes in the economy between these two years. It should be borne in mind that two of the divisions, namely, finance, insurance and real estate and public administration and defence are not considered to be comparable for the reasons outlined above. As can be seen, there was a significant decline in such primary industries as agriculture, while most of the service-producing industries increased their share considerably.

Comparison of the	Industrial	Distribution	of Gross	Domestic	Product
	t Factor (Cost for 1949	and 1961	1	

S.I.C. Code	Industry title	1949	1961
		per	cent
1 2 3 4 5 6 7-4	Goods-producing industries Agriculture Forestry Fishing and trapping Mines, quarries and oil wells Manufacturing Construction Electric power, gas and water utilities Other goods industries, n.e.c.	53.080 10.714 2.108 .540 3.245 27.340 6.379 1.646 1.108	43. 767 4. 557 1. 257 . 262 4. 298 24. 741 5. 840 2. 812
7 8 9 10 11	Service-producing industries Transportation, storage and communication Trade Finance, insurance and real estate Community, business and personal service Public administration and defence Total Gross Domestic Product	46.920 8.363 14.562 9.127 10.202 4.666	56. 233 9. 985 12. 721 12. 013 13. 789 7. 725 100. 000

¹ As noted above, conceptual differences exist between the 1949 and 1961 estimates for individual industries, hence they are not strictly comparable. This applies particularly to finance, insurance and real estate and public administration and defence.

Real Domestic Product Measures 1961-67

Turning to the annual industry measures for the post-1961 period, it is important to note that as a general rule comprehensive annual benchmark indexes have not been incorporated into the record for this period, although preliminary annual levels were calculated for many individual industries. The annua.l indexes for the post-1961 period shown in Table 1 are therefore preliminary and subject to change at the time of the next major revision to the Real Domestic Product system. They are derived by taking the annual averages of the sub-annual measures after adjustment to preliminary annual levels where available. One of the major changes to be incorporated in the near future will be the inclusion in the output measures of all activities of an establishment for such industry areas as manufacturing and mining. It is expected that the year-to-year changes due to this factor will not be significant. At the same time some methodology improvements will also be incorporated, such as the more widespread use of the industry selling price indexes which will shortly be available on a 1961 base and on the 1960 S.I.C. In areas such as trade and services it is expected to incorporate the 1966 quinquennial census data. Similarly, in other industry areas data from new or improved surveys will be utilized wherever possible. As a result, the revisions to individual industry measures may be relatively important, although it is not anticipated that they would alter general trends or sub-annual movements to any significant extent.

The sub-annual measures for the period commencing 1961 have been completely reworked using the 1960 S.I.C. and 1961 industry and price weights throughout. Improved methodology was applied wherever possible and more suitable data sources were utilized for those industries where new surveys or other basic data improvements had been instituted during the 1960's. This applies both to the monthly Index of Industrial Production and its components, and to all the other industries incorporated in the quarterly Real Domestic Product system.

One example of a change in methodology which may be of general interest is the use of an improved method of seasonal adjustment. Quarterly estimates of Real Domestic Product (including the monthly Index of Industrial Production) are all seasonally adjusted using the X-11 variant of the previously used Census Method II, developed by the United States Bureau of the Census. The method basically remains as described in reference papers DBS Catalogue No.'s 61-502 and 61-505, the major change being a new method for the identification and treatment of extreme or irregular observations. The X-11 method has been used for the entire Real Domestic Product system from 1961 forward, in the reseasonal adjustment of the major group components of the Index of Industrial Production from 1935 to 1945, and in the seasonal adjustment of the full detail of the revised Real Domestic Product measures (other than the Index of Industrial Production) from 1949-60.

Users will also recall that the previous 1949-based system employed a "mid-month" adjustment for labour-represented series, designed to reflect in employment measures a period closer to the middle of the month, since the employment survey measures activity for the last pay period in the month, normally the last week. This mid-month adjustment technique has been discontinued, effective with this revision, beginning in January 1961.

It might also be noted that the plan eventually is to present all seasonally unadjusted data on a pure raw or absolute basis, which will require that all sub-annual series which are presently labour-represented will have to have the effects of the differing lengths in the calendar months re-inserted into these series. At the present time, all seasonally unadjusted series in the entire Real Domestic Product System are published on a 'rate-adjusted' basis.

In the case of the monthly Index of Industrial Production (1961-67), the incorporation of all the above changes did not basically alter its composition in terms of the types of indicators between the 1961 base and the previous base period. For example, in terms of 1949 industry weights, 39.8 per cent of the Index (amounting to 12.8 per cent of Real Domestic Product) was represented by labour input measures, while on the 1961 base, manhour representation amounted to 36.4 per cent and 11.6 per cent respectively of these two aggregates.

However, in terms of methodology applied, some of the changes were important enough to warrant discussion. For example, effective with January 1961, this revision incorporates a new method of calculating monthly manhour indexes. Previously, the method was simply to index the total manhours as reported to the monthly employment survey for each industry so represented. The new method consists in indexing the product of the total employment index and the series on average hours paid to hourly-rated production workers. Apart from its operational advantages, this measure comes closer to a comprehensive employment count, since the employment index encompasses both hourly-rated and salaried workers.

It should be stressed that the entire post-1961 period for the Index of Industrial Production components remains preliminary, partly due to the pending implementation of the final comprehensive benchmark levels. For the present revision to the Index of Industrial Production, in general, preliminary benchmarks are incorporated up to 1964, and estimated up to the most current years, largely using data from the monthly Current Shipments, Inventories and New Orders survey, along with appropriate price indexes and other related data.

Finally, calendar variation adjustments are still applied to the non-labour represented components of the Index designed to re-express current production from an absolute to a "rate" basis. This adjustment is not applied to labour represented series, since these series are already on a "rate" basis in their raw form, referring as they do to a common pay period each month. For those series requiring explicit correction, the adjustment is based on a more up-to-date study, exploiting data from the October 1966 monthly employment survey.

In the case of the **quarterly Real Domestic Product system**, the adoption of the 1961 base and the 1960 S.I.C. resulted in a considerable expansion

in industry detail: 86 industries and aggregates are being published on a quarterly basis in Table 4, instead of the earlier 43. The sub-annual measures outside the Index of Industrial Production are based on deflated output measures for 59 per cent; labour input measures for 27 per cent; and other types of indicators for 14 per cent of G.D.P. originating in these industries.

The major changes in individual industry methodology occurred in agriculture, construction and some of the transportation and service industries. In agriculture, intermediate inputs are now computed, thus permitting the calculation of a net output measure on a quarterly basis. As a result, estimates for the agriculture industry and total Real Domestic Product will henceforth be published each quarter. In the case of construction, new projectors have been developed for the non-residential building, highways and engineering series. Improvements in methodology have also been made to the residential construction series. Furthermore, the estimates are adjusted to preliminary annual levels which incorporate a productivity adjustment and measure industry output rather than total construction activity. In transportation, a net output measure was developed for air transport on a quarterly basis. while in the case of railway transport, more detailed ton-mile estimates were derived in order to yield a better representation of sub-annual movements in periods of rapidly changing product mix. In the service industries, many projectors continue to be based on labour input or employment data, but it was generally possible to develop these at lower levels of industry detail, thus yielding a better depiction of sub-annual movements over time.

As in the case of the Index of Industrial Production components, the entire quarterly post-1961 record is subject to revision, pending the incorporation of comprehensive annual benchmark levels, some of which, such as those for trade, cannot be developed until the results of the 1966 Census of Merchandising and Services become available. Nevertheless, it should be noted that many preliminary annual levels have already been incorporated into the current record. At the same time, basic quality improvements, both in terms of methodology and data, will continue to be made in this area and will be incorporated into the historical record at the time of the next revision. One major development which might be of interest to users is the conversion of the entire Real Domestic Product system to a monthly basis. This project is at present well underway and should result not only in analytically more useful data but also some improvements in the timeliness of release.

Real Domestic Product Measures, 1946-61

Turning to the 1949-based measures contained in Tables 2, 7, 8 and 9, it will be recalled that the revisions from previously published levels originated almost entirely from industries outside of the Index of Industrial Production. Within the Index of Industrial Production, the change came solely from

manufacturing and was confined to the years 1959 and 1960 in the monthly and the years 1960 and 1961 in the annual tables. As explained above, the 1961-based industry detail for manufacturing had to be linked into the 1949-based system in the year 1959 at the lowest level of comparable industry detail in order to carry the system forward to 1961. In order to approximate the old system as closely as possible, it was found necessary in some instances to move individual 3-digit industries between major groups, to carry forward estimates of industries which had been dropped from the manufacturing universe as part of the implementation of the 1960 S.I.C. and exclude any that had been added. While 1961 price and industry weights had to be used at the lowest worksheet level, the industries or industry groups which were considered comparable were weighted together using 1949 industry weights. This resulted in some compression of industry detail for the years 1960 and 1961, but permitted the incorporation of the manufacturing estimates into the 1949-based Real Domestic Product system for these years. The full industry details used in bridging this gap are shown in Appendices II and III, the former containing annual data for the link year 1959 on a 1949 base (1948 S.I.C.) and the latter the full 1961-based (1960 S.I.C.) detail for the years 1959 and 1960. All indexes for the year 1961 would, of course, equal 100 in this case. These tables, used in conjunction with the "Guide to Classification Links" provide the basic material needed to bridge the gap between the two classification systems. It should be stressed, however, that the aggregates in Appendix III, other than those which form the lowest levels of comparability, have been developed using the 1961 industry weighting system rather than the 1949 system which was used in deriving the continuous series presented in Tables 1 and 2 and thus show different year-to-year movements. They do not, therefore, form part of the official historical record presented in this report and are shown for comparison purposes only.

The monthly series for manufacturing have been re-adjusted to the new annual benchmark levels for the year 1960 at the levels at which the two S.I.C. systems could be matched. This resulted in a marginal increase in the level of the previously published data for total manufacturing.

The revisions were far more significant for the remainder of the Real Domestic Product system. Within the goods-producing industries, the bulk of the revision came from the use of improved price indexes employed in deflating construction values. The net effect of the revision was to raise the level

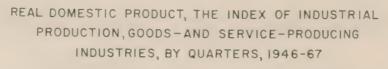

of output over time in the manner of a trend adjustment, which reached 14.4 per cent by 1961 and accounted for close to 30 per cent of the total revision to Real Domestic Product for that year. Minor revisions extending back to 1950 were made to the agriculture industry estimates. These consisted largely of the incorporation of 1961 Census levels into the historical record, but also included some changes in methodology. Another 30 per cent of the revision to total RDP in 1961 originated from the grouping of manufacturing repair establishments, contract drilling and municipal waterworks, which was published under the heading "other goods industries, n.e.c." in the 1949-based system. Most of the increase here came from adjustments to the manufacturing repair establishments component which had been extrapolated on related data from its 1951 decennial census base and required a considerable upward adjustment once the 1961 Census data became available.

An upward revision of 2.3 per cent in 1961 in the service-producing industry group accounted for another one third of the total revision to Real Domestic Product. Most of the increase came from the incorporation of 1961 Census levels into the historical record for trade and some of the service industries. It should also be noted that in the case of wholesale trade the store-type detail for the entire post-1949 period was reworked to provide continuous annual series at the store-type level. As part of this work, new constant dollar series had to be calculated using new 1949-based store-type deflators developed for this purpose. The deflators used previously were on a 1941 base. The upward revisions were to some extent offset by slight downward adjustments in finance, insurance and real estate, public administration and defence and transportation, storage and communication during the late 1950's. It should be remembered that for this period the more comprehensive annual benchmarks had not as yet been incorporated into the previously published series for some industries. The revisions resulted largely from the use of later data and some changes in methodology.

The basic methodology and industry projectors for the quarterly Real Domestic Product measures remained unchanged for this period. In some minor instances, however, later data were incorporated into the system. All industries were adjusted to the new comprehensive annual benchmark levels and the entire system was re-seasonally adjusted using the X-11 variant of Census Method II. Thus the quarterly industry measures show revisions as of the first quarter of 1949.

Includes agriculture, forestry, fishing, trapping, mining, manufacturing, electric power, gas and water utilities and construction.

Includes transportation, storage and communication; trade; finance, insurance and real estate; public administration and defence; community, business Non-commercial industries include public administration and defence; education and related institutions; hospitals; welfare organizations; religious classified as commercial.

Includes mining, manufacturing and electric power, gas and water utilities. The remaining industries are for annual levels of the Index of Industrial Production; mining; manufacturing; electric power, gas and water utilities and for electric power prior to For this series non-availability of data is due to a break in historical continuity.

Data for this series will be published when comprehensive levels are incorporated in the system.

The breakdown by store-type as used in the Merchandising and Services Division was adopted for RDP measures, instead of the S.I.C. breakdown.

¹ Includes agriculture, forestry, fishing, trapping, mining, manufacturing, electric power and gas utilities and construction.
² Includes transportation, storage and communication; trade; finance, insurance and real estate; public administration and defence; community, recreation, business and personal service.
³ Non-commercial industries include: public administration and defence; hospitals; education; domestic service; welfare, religion and other community service, n.e.c. The remaining industries are classified as commercial.
⁴ Includes mining, manufacturing and electric power and gas utilities. Certain industries. namely contract drilling and manufacturing repair are excluded here and included in a group "other goods industries, n.e.c.". See footnote in Appendix I for exclusions.
³ Miscellaneous products of petroleum and coal, S.I.C. 379, are included with S.I.C. 369 for comparability with earlier years.
⁵ Dominion Post Office, S.I.C. 914 is excluded from public administration and defence and included in communication in RDP measures.
⁻ The breakdown by store-type as used in the Merchandising and Services Division was adopted for RDP measures instead of the S.I.C. breakdown.

¹ Includes agriculture, forestry, fishing, trapping, mining, manufacturing, electric power and gas utilities and construction.
² Includes transportation, storage and communication; trade; finance, insurance and real estate; public administration and defence; community, recreation, business and personal service.
¹ Non-commercial industries include public administration and defence; hospitals; education; domestic service; religion and other community service, n.e.c.
The remaining industries are classified as commercial.
¹ Includes mining, manufacturing and electric power and gas utilities. Certain industries, namely contract drilling and manufacturing repair, are excluded nicluded in a group "other goods industries, n.e.c.". See footnote in Appendix I for exclusions.
¹ Flour mills and feed mills are combined in this period with a weight of 0.397.
¹ Total miscellaneous foods include biscuits and confectionery in this period.
¹ Dominion Post Office, S.I.C. 914 is excluded from Public administration and defence and included in Communication in RDP measures.
® Warehousing is included with transportation in this period.
⁰ The breakdown by store-type as used in the Merchandising and Services Division was adopted for RDP measures, instead of the S.I.C. breakdown.

¹ Unpublished data for particular periods and particular periodicities on the originally-used base period are now being brought together and a list is presently being prepared. In some cases in Table 6 where non-availability of monthly indexes is indicated, annual indexes may exist in Table 1. The intention is to make some additional data available to users on request. Users will be notified of the completion of this list through DBS Catalogue No. 61-005.

¹ Unpublished data for particular periods and particular periodicities on the originally-used base period are now being brought together and a list is presently being prepared. In some cases in Table 6 where non-availability of monthly indexes is indicated, annual indexes may exist in Table 1. The intention is to make some additional data available to users on request. Users will be notified of the completion of this list through DBS Catalogue No. 61-005.

APPENDIX I

Guide to Industry Classification Links, 1948 and 1960 Standard Industrial Classification Systems

Note: This appendix compares the 1960 "Standard Industrial Classification" (S.I.C.), Catalogue No. 12-501, and subsequent modifications, with the previous Standard Industrial Classification published by DBS in 1948. The industries in the two classification systems are aligned in such a way as to indicate general comparability. However, where in addition to being aligned, an asterisk appears in the "link level" column, corresponding Real Domestic Product (RDP) measures, if available, are considered to be sufficiently comparable to be linked, i.e., considered continuous. The tables in this report list RDP measures available at this time. Since RDP annual benchmarks are not final beyond 1961, some minor revisions to linked series can be expected when final post-1961benchmarks are calculated.

marks are ca	lculated.						
1961 Gross Domestic Product	Division, group or industry	1960 S.I.C. No.	Link level		1948 S.I.C. No.	Division, group or industry	1949 Gross Domestic Product
4.507	Division 1 - Agriculture		*	Agriculture is measured in total since neither the 1948 nor the 1960 S.I.C.3-digit industry de- tail has been followed in data collection.		Division 1 - Agriculture	7/ 10.714
1.257	Division 2 — Forestry Major group 1 — Logging Logging Major group 2 — Forestry services Forestry services	031	*	Porestry is measured in total.	080	Division 2 — Forestry	2.108

APPENDIX III

Real Domestic Product in Manufacturing, 1959-61, by Years (1960 S.I.C.)

Indexes: 1961 = 100

Note: The indexes shown in this appendix result from a special compilation of 1960 S.I.C.-based data including a special retabulation of 1959 data in order to up-date the 1949 weight-based (1948 S.I.C.) indexes. Thus although individual industry measures form part of the official record shown in Tables 1, 4, 5, and 6, the aggregates in this table do not necessarily correspond with the official tables be made of the fact that we list of 1949 were used in their aggregation. This table is provided to show the additional industrial detail that could not be shown. Table 2, By emparate which Table 1, users will note the effect of the different weights on this period. See technical notes page 7 for further detail.
